4.5 Worksheet: The Fundamental Theorem of Calculus

Purpose: The Fundamental Theorem of Calculus can look like it comes out of nowhere. In this worksheet we will try to explain why it is true through examples.

1. **Area functions:**

   a) Let $f(x)$ be the graph to the right and let $A(x) = \int_0^x f(x)\,dx$ be its *area function*. For this problem, use geometry to calculate the areas under the curve to compute the following.

   $A(1) =$ _____ $A(3) =$ _____

   $A(2) =$ _____ $A(4) =$ _____

   and, in general, $A(x) =$ _____
   (hint: think triangle plus rectangle)

   Take the derivative to compute
   $A'(x) =$ _____

   How does $A'(x)$ compare to $f(x)$?

   b) Let $f(x)$ be the function with the given graph to the right and let $A(x) = \int_0^x f(x)\,dx$ be its area function. Compute the following.

   $A(1) =$ _____ $A'(1) =$ _____

   $A(2) =$ _____ $A'(2) =$ _____

   $A(3) =$ _____ $A'(3) =$ _____

   $A(4) =$ _____ $A'(4) =$ _____

   The maximum value of $A(x)$ on the interval $[0, 5]$ is _____.

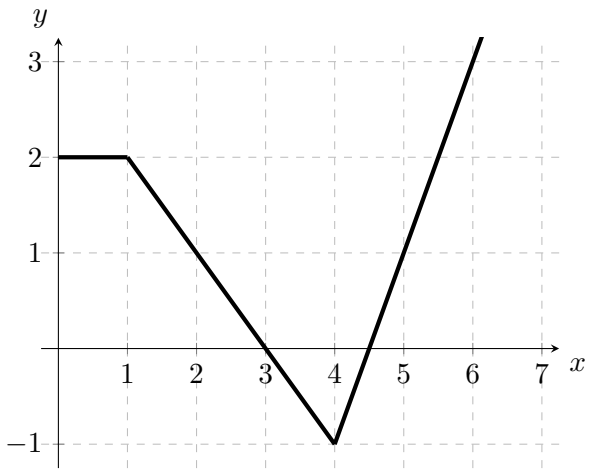
   The maximum value of $A'(x)$ on the interval $[0, 5]$ is _____.

2. **Velocity and Position:** A toy car is travelling on a stright track. Its velocity $v(t)$, in m/s, is given by the graph to the right. Define $s(t)$ to be the position of the car in meters. Choose coordinates so that $s(0) = 0$. Compute the following.

$s(2) =$ _____ $v(2) =$ _____

$s(4) =$ _____ $v(4) =$ _____

$s(6) =$ _____ $v(6) =$ _____



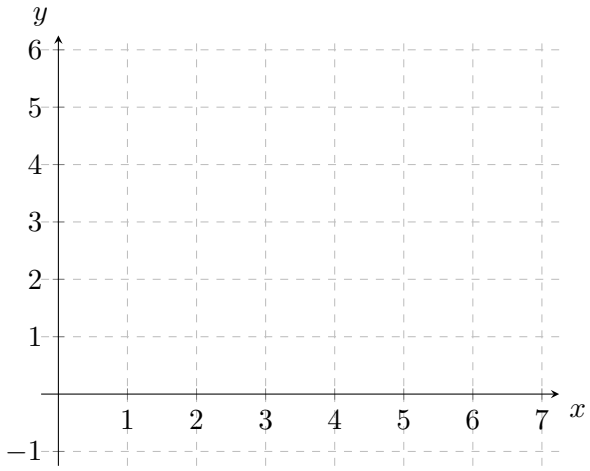
(a) What is the maximum value of $s(t)$ on the interval $[0, 6]$?

(b) What is the minimum value of $s(t)$ on the interval $[0, 6]$?

(c) What is the maximum value of $v(t)$ on the interval $[0, 6]$?

(d) What is the minimum value of $v(t)$ on the interval $[0, 6]$?

Sketch a graph of $s(t)$ on the empty graph to the right.



(a) What is the net change in position from $t = 1$ to $t = 3$?

(b) What is area under the velocity graph from $t = 1$ to $t = 3$?

(c) What is the net change in position from $t = 4$ to $t = 6$?

(d) Use the Fundamental theorem of calculus to compute the integral $\int_4^6 v(t)\,dt$.

3. **Extra Problems:** Use the Fundamental Theorem of Calculus to compute the definite integrals:

a) $\int_0^2 2x - 3\,dx$

b) $\int_0^1 6e^{-3x} + 4\,dx$

c) $\int_0^{\pi/4} \sec(t)\tan(t)\,dt$

d) $\int_0^{1/2} \frac{3}{\sqrt{1-x^2}}\,dx$
